No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4, A

contained the 1788 bp sequence. A 300 bp 3'-terminal segment of this was used to identify 4 other Ikanos isoforms (see 442807-10). Different isoforms arise by differential splicing of Ikaros gene transcripts. Isoform mIk-2 lacks exon 3. It is expressed in embryonic liver, thymns and brain, but only in thymns and splaen after birth. The Ikaros gene is located at the proximal arm of murine chromosome 11. Ikaros proteins are suggested to play a role as a genetic switch regulating entry into the T cell lineage. The murine and human (see V42806, V42811 and V4280) Ikaros sequences are very similar. The invention provides Ikaros nucleic acids, cetors and host cells expressing Ikaros proteins. These are used to treat T and B cell diseases (e.g. timmune deficiencies caused by drugs, radiation or cancers), to control expression of heterologous cross placed under control of an Ikaros responsive element, to modulate cell division, amplification or differentiation, especially the namatopoietic cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. The same effect can be achieved with Ikaros-binding oligonucleotides.

Transgenic rodent having Ikaros trans-gene (pref. mutated) - is severely immuno-compromised and can be used as model to determine referets of treatment for immune and nervous system disorders. Disclosure: Page 63-64; 102pp; English.

CDNA clones (716059 and 716061-64) encode different isoforms, mix-3, mix-1, mix-4 and mix-5 (R92014 and R92016-19).

C mix-2, mix-3, mix-1, mix-4 and mix-5 (R92014 and R92016-19).

C respectively), of the mouse Ikaros protein, a master regulator of hematopoietic differentiation. They were isolated from a mature controlline E-14 cDNA library. The isoforms arise by differential splicing of the Ikaros genomic locus. All include exons E1/2 and E7, but have different combinations of exons E3-E6 encoding a zinc finger domain. Transgenic animals, pref. mice, having a mutated Ikaros transgene, esp. a mutation that all, iss the DNA binding domain of the Ikaros protein, are used as models to determine the effects of treatments for immune or nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              458 CCTTTACCCAGAAAGGCAACCTCCTGCGGCACATCAAGCTGCACTCGGGTGAGAGCCCT 517

Disclosure; Column 51-56; 111pp; English.

The present invention describes a purified peptide having at least one of the following properties: (a) it stimulates transcription of a DNA sequence under the control of a delta A element, an NFRB element or an Ikaros binding oligonucleotide consensus sequence; (b) it binds to any of a delta A element, an NFRB element or an Ikaros binding oligonucleotide consensus sequence; (c) it competitively inhibits the binding of a naturally occurring Ikaros isoform to any of a delta A element, an NFRB competitively inhibits protein-protein interactions of transcriptional complexes competitively inhibits protein-protein interactions of transcriptional complexes that they stimulate gene transcription under the control of delta A elements, NFRB elements and/or Ikaros-binding oligonucleotides, competitively inhibit binding of naturally occurring Ikaros isoforms to delta A elements, NFRB elements and/or Ikaros-binding oligonucleotides, competitively inhibit binding of naturally occurring Ikaros isoforms to delta A elements, NFRB elements and/or Ikaros-binding oligonucleotides, competitively inhibit Ikaros binding to Ikaros-responsive elements and/or iharos-responsive elements and/or iharos-re
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence encodes a specifically claimed mouse Ikaros protein. 437 A; 486 C; 495 G; 370 T;

The Ikaros gene encodes a zinc finger protein which can be used in therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is a fish for an immune disorder. It is of particular use in treating a disorder of the corpus striatum.

Transgenic rodent having Ikaros trans-gene (pref. mutated) - is severely immuno-compromised and can be used as model to determine effects of treatment for immune and nervous system disorders. Disclosure: Fig 1: 102pp; English.

CDNA clones (T16059 and T16061-64) encode different isoforms, mix-1, mix-4 and mix-5 (R92014 and R92016-19, caspectively), of the mouse Ikaros protein, a master regulator of hematopoietic differentiation. They were isolated from a mature T-cell in E-14 cDNA library. The isoforms arise by differential splicing of the Ikaros genomic locus. All include exons E1/2 and E7, but have different combinations of exons E3-E6 encoding a zinc finger domain. Transgenic annuals, pref. mice, having a mutated likaros transgene, esp.

a mutation that alters the DNA binding domain of the Ikaros protein, a mutation that alters the DNA binding domain of the Ikaros protein, a models to determine the effects of treatments for immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gcatgccaaagaagagatgcgctcacggggcatcttaggacacattctgtggagaaaccc 408

New nucleic acid encoding Ikaros protein involved in early differentiation of lymphocytes - existing in several isoforms, and related products, used to treat e.g. immune diseases or cancer and to control cell differentiation

First st page 75-77; 158pp; English.

Claim 7; Page 75-77; 158pp; English.

Codes for a 518-amino acid 2inc finage protein (see W12805) as mix-1 contains all 7 content and fortified. These arise by differential all 7 contents and the postnatal spleen. The Ixaros gene is not attained at the proximal arm of murine chromosome 11. Ixaros proteins are suggested to play a role as a genetic switch are unded to active and human (see V42806, V42811 and V42840) Ixaros sequences are very similar.

The invention provides Ixaros nucleic acids, vectors and host cells cancers), to control expression of heterologous genes placed under control of an Ixaros responsive element, to treat nervous system diseases (e.g. immune deficiencies caused by drugs, radiation or cancers), to control expression of heterologous genes placed under control of an Ixaros responsive element, to treat nervous system cancers), to control expression of heterologous genes placed control amplification or differentiation, especially in haematopoletic can be achieved with Ixaros sequences. The same effect can be achieved with Ixaros gene, or its all and achieved with its are antagonistic of these sequences can be achieved by achieved by achieved to see the expression of the same effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 146 ccagtggaaagatgaactgcgatgtgtgtggattatcctgcatcagcttcaatgtcttaa 205

                                                                                                                                                                                                                                                 ñ
competitively inhibit Ikaros binding to Ikaros-responsive elements and/or inhibit protein-repotein interactions of transcriptional complexes with naturally occurring Ikaros isoforms, can be used to treat immune system disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence encodes a specifically claimed mouse Ikaros protein. 531 C; 574 G; 430 T;

ACCOMPANTANT NEW WINDER NEW WINDE

```
System of colpum stilatum

Disclosure; Column 61-66; 111pp; English.

The present invention describes a purified peptide having at least one
of the following properties: (a) it stimulates transcription of a DNA
sequence under the control of a delta A element, an NFKB element or an
Ikaros binding oligonuclectide consensus sequence; (b) it binds to any of
a delta A element, an NFKB element or an Ikaros binding oligonuclectide
consensus sequence; (c) it competitively inhibits the binding of a
consensus sequence; (d) it competitively inhibits the binding of a
competitively inhibits Ikaros binding to Ikaros responsive element; or
(e) it inhibits Ikaros binding to Ikaros responsive elements; or
(e) it inhibits protein protein interactions of transcriptional complexes
(formed with naturally occurring Ikaros isoforms. The proteins, provided
that they stimulate gene transcription under the control of delta A
ce elements, NFKB elements and/or Ikaros-binding oligonucleotides,
celements, NFKB elements and/or Ikaros-binding oligonucleotides,
competitively inhibit binding of naturally occurring Ikaros isoforms to
delta A elements, NFKB elements and/or Ikaros-binding oligonucleotides,
                                                                                                                                                                                                                                                                                                                                                   V66971;
14-JAN-1999 (first entry)
Mouse Ikaros encoding cDNA mIk-1.

GD3-delta gene; Ikaros gene; T cell; progenitor stem cell; leukaemia; differentiation marker; immune system; corpus striatum; AIDS; Alzheimer's disease; ss.

Disclosure: Page 65-67; 102pp; English.

CDNA clones (T16059 and T16061-64) encode different isoforms, mlx-2, mlx-3, mlx-1, mlx-4 and mlx-5; (R32014 and R92016-19). Fespectively), of the mouse Ikaros protein, a master regulator of hematopoietic differentiation. They were isolated from a mature colling to the Ikaros genomic locus. All include exons E1/2 and E7, but have different combinations of exons E3-E6 encoding a mutated Ikaros transgenic animals, pref. mice, having a mutated Ikaros transgene, esp. a mutation that alters the DNA

Claim: 1. Page 127-129: 158pp: English.

Codes for a 516-amino acid zinc finger protein (see W70971) that is involved in the early differentiation of lymphocytes. It was involved in the early differentiation of lymphocytes. It was involved in the early differentiation of lymphocytes. It was involved in the early differentiation of lymphocytes. It was controlled from a Jurkat T cell line library using mouse Ikaros exon throws as probe. The Ikaros gene maps between pli.2-pl3 on human chromosome 7. The human and murine Ikaros sequences (see V42805-11 and V42840) are highly conserved. Differential splicing of Ikaros proteins. These are used to treat T and B cells expressing Ikaros proteins. These are used to treat T and B cells expressing Ikaros proteins. These are used to treat T and B cells cancers), to control expression of heterologus genes placed under control of an Ikaros-responsive element, to treat nervous system cancers), to control of an ikaros-responsive element, to treat nervous system diseases (e.g. Alzheimer's disease) and to modulate cell division, amplication or differentiation, especially in haematopolette.

C cells. Some Ikaros isoforms are antagonistic of others and may be used to inhibit interaction with DNA sequences. The same effect can be achieved with Ikaros binding oligonucleotides. Examining the expression of the Ikaros gene, or its allelic structure, can be used to assess risk of acquiring the above diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             146 ccagiggaaagaigaacigcgaigigigigatiaiccigcaicagciicaaigiciiaa 205

Disclosure; Column 55-58; Illpp; English.

The present invention describes a purified peptide having at least one
of the following properties: (a) it stimulates transcription of a DNA
sequence under the control of a delta A element, an NFKB element or an
ikaros binding oligonucleotide consensus sequence; (b) it binds to any of
a delta A element, an NFKB element or an ikaros binding oligonucleotide
consensus sequence; (c) it competitively inhibits the binding of a
adurally occurring ikaros isoform to any of a delta A element, an NFKB
element or an ikaros binding oligonucleotide consensus sequence; (d) it
competitively inhibits ikaros binding to ikaros responsive elements; or
(e) it inhibits protein protein interactions of transcriptional complexes
formed with naturally occurring ikaros isoforms. The proteins, provided
that they stimulate gene transcription under the control of delta A
elements, NFKB elements and/or ikaros binding oligonucleotides, bind
delta A elements, NFKB elements and/or ikaros-binding oligonucleotides,
competitively inhibit ikaros binding to ikaros-responsive elements and/or
competitively inhibit ikaros binding to ikaros-responsive elements and/or
competitively inhibit ikaros binding to ikaros-responsive elements and/or
contenting interactions of transcriptional complexes with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     naturally occurring Ikaros isoforms, can be used to treat immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disorders, e.g. leukaemia or AIDS, or corpus striatum disorders, e.g. Alzheimer's disease. The present sequence encodes a specifically claimed human Ikaros protein.

Transgenic rodent having Ikaros trans-gene (pref. mutated) - is severally immuno-compromised and can be used as model to determine effects of treatment for immune and nervous system disorders. Disclosure; Fig 2: 102pp; English.

Chalmost full-length cDNA sequence (T16060) codes for part (R92015) of the human Ikaros protein, a master regulator of haematopoietic differentiation. It was isolated from a T-cell in Jurkat cDNA library using a mouse Ikaros cDNA clone as probe. The human Ikaros gene maps to pll 2-pl3 on chromosome 7.

Chief profit isoforms (see R92014 and R92016-19) of mouse Ikaros have also been isolated. Transgenic animals, pref. mice, having a mutated ikaros transgene, esp. a mutation that alters the DNA binding domain of the Ikaros protein, are used as models to determine the effects of treatments for immune or nervous system
                                                                                                                                                                                                                                                                                                                           CTAACGGAAAACTAAAGTGTGATATCTGTGGGATCATTTGCATCGGCCCAATGTGCTCA 232

Aiolos (W15574) can form dimers with Aiolos or Ikaros polypeptides, is expressed in committed lymphoid progenitors and in T and B cells, and is a transcriptional activator of a lymphoid gene. Primers (see also T60494-95) based on mouse Aiolos gene exons were used to may library a human partial Aiolos cDNA (see also T60491). Aiolos CDNA can be used to produce recombinant Aiolos in transformed host cells. The Aiolos polypeptide, coding sequence or cells expressing Aiolos CDNA can be used to treat a disorder in an animal, esp. by gene therapy. Such disorders include T-cell leuksemias and lymphomas. Transgenic animals are provided with an Aiolos transgenic canimals are provided with an Aiolos transgenic Sequence 1984 BP; 512 A; 570 C; 535 G; 367 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treell pathway regulatory gene, Ikaros - encodes family of unique zinc finger proteins, useful for treating immune system disorders claim 13: page 44-46; 112pp; English.

The Ikaros gene encodes a zinc finger protein which can be used in therapeutic composition to treat animals with an immune system disorder. It may also be used for assessing whether a subject is a risk for an immune disorder. It is of particular use in treating a Sequence 1611 BP; 375 A; 484 C; 480 G; 272 T;
